### **Optimization for Fully Connected Networks**

In this notebook, we will implement different optimization rules for gradient descent. We have provided starter code; however, you will need to copy and paste your code from your implementation of the modular fully connected nets in HW #3 to build upon this.

CS231n has built a solid API for building these modular frameworks and training them, and we will use their very well implemented framework as opposed to "reinventing the wheel." This includes using their Solver, various utility functions, and their layer structure. This also includes nndl.fc\_net, nndl.layers, and nndl.layer\_utils. As in prior assignments, we thank Serena Yeung & Justin Johnson for permission to use code written for the CS 231n class (cs231n.stanford.edu).

```
In [1]:
         ## Import and setups
         import time
         import numpy as np
         import matplotlib.pyplot as plt
         from nndl.fc_net import *
         from cs231n.data_utils import get_CIFAR10_data
         from cs231n.gradient check import eval numerical gradient, eval numerical gradie
         from cs231n.solver import Solver
         %matplotlib inline
         plt.rcParams['figure.figsize'] = (10.0, 8.0) # set default size of plots
         plt.rcParams['image.interpolation'] = 'nearest'
         plt.rcParams['image.cmap'] = 'gray'
         # for auto-reloading external modules
         # see http://stackoverflow.com/questions/1907993/autoreload-of-modules-in-ipytho
         %load_ext autoreload
         %autoreload 2
         def rel error(x, y):
           """ returns relative error """
           return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) + np.abs(y))))
In [2]:
         # Load the (preprocessed) CIFAR10 data.
         data = get_CIFAR10_data()
         for k in data.keys():
           print('{}: {} '.format(k, data[k].shape))
        X train: (49000, 3, 32, 32)
        y train: (49000,)
        X val: (1000, 3, 32, 32)
        y_val: (1000,)
        X_test: (1000, 3, 32, 32)
        y test: (1000,)
```

### Building upon your HW #3 implementation

Copy and paste the following functions from your HW #3 implementation of a modular FC net:

- affine\_forward in nndl/layers.py
- affine\_backward in nndl/layers.py
- relu\_forward in nndl/layers.py
- relu\_backward in nndl/layers.py
- affine\_relu\_forward in nndl/layer\_utils.py
- affine\_relu\_backward in nndl/layer\_utils.py
- The FullyConnectedNet class in nndl/fc\_net.py

#### Test all functions you copy and pasted

```
In [3]:
         from nndl.layer tests import *
         affine_forward_test(); print('\n')
         affine_backward_test(); print('\n')
         relu_forward_test(); print('\n')
         relu_backward_test(); print('\n')
         affine relu test(); print('\n')
         fc_net_test()
        If affine forward function is working, difference should be less than 1e-9:
        difference: 9.769849468192957e-10
        If affine_backward is working, error should be less than 1e-9::

## Training a larger model

In general, proceeding with vanilla stochastic gradient descent to optimize models may be fraught with problems and limitations, as discussed in class. Thus, we implement optimizers that improve on SGD.

#### SGD + momentum

In the following section, implement SGD with momentum. Read the nndl/optim.py API, which is provided by CS231n, and be sure you understand it. After, implement sgd\_momentum in nndl/optim.py. Test your implementation of sgd\_momentum by running the cell below.

```
In [4]:
        from nndl.optim import sgd momentum
        N, D = 4, 5
        w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
        dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
        v = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)
        config = {'learning_rate': 1e-3, 'velocity': v}
        next_w, _ = sgd_momentum(w, dw, config=config)
        expected next w = np.asarray([
          [ 0.1406,
                     0.20738947, 0.27417895, 0.34096842, 0.40775789],
          [0.47454737, 0.54133684, 0.60812632, 0.67491579, 0.74170526],
          [ 0.80849474, 0.87528421, 0.94207368, 1.00886316, 1.07565263],
          [ 1.14244211, 1.20923158, 1.27602105, 1.34281053, 1.4096
                                                                         11)
        expected_velocity = np.asarray([
          [ 0.5406,
                     0.55475789, 0.56891579, 0.58307368, 0.59723158],
          [0.61138947, 0.62554737, 0.63970526, 0.65386316, 0.66802105],
          [0.68217895, 0.69633684, 0.71049474, 0.72465263, 0.73881053],
          [ 0.75296842, 0.76712632, 0.78128421, 0.79544211, 0.8096
        print('next w error: {}'.format(rel error(next w, expected next w)))
        print('velocity error: {}'.format(rel_error(expected_velocity, config['velocity'
```

next\_w error: 8.882347033505819e-09
velocity error: 0.05287786616752459

### SGD + Nesterov momentum

Implement sgd\_nesterov\_momentum in ndl/optim.py .

```
In [5]:
    from nndl.optim import sgd_nesterov_momentum

N, D = 4, 5
w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
v = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)
```

```
config = {'learning rate': 1e-3, 'velocity': v}
next_w, _ = sgd_nesterov_momentum(w, dw, config=config)
expected_next_w = np.asarray([
 [0.08714, 0.15246105, 0.21778211, 0.28310316, 0.34842421],
 [0.41374526, 0.47906632, 0.54438737, 0.60970842, 0.67502947],
 [0.74035053, 0.80567158, 0.87099263, 0.93631368, 1.00163474],
 [1.06695579, 1.13227684, 1.19759789, 1.26291895, 1.32824]
                                                             11)
expected_velocity = np.asarray([
 [ 0.5406,
            0.55475789, 0.56891579, 0.58307368, 0.59723158],
 [0.61138947, 0.62554737, 0.63970526, 0.65386316, 0.66802105],
 [0.68217895, 0.69633684, 0.71049474, 0.72465263, 0.73881053],
 [ 0.75296842, 0.76712632, 0.78128421, 0.79544211, 0.8096
                                                               11)
print('next_w error: {}'.format(rel_error(next_w, expected_next_w)))
print('velocity error: {}'.format(rel_error(expected_velocity, config['velocity
```

next\_w error: 1.0875186845081027e-08
velocity error: 4.269287743278663e-09

# Evaluating SGD, SGD+Momentum, and SGD+NesterovMomentum

Run the following cell to train a 6 layer FC net with SGD, SGD+momentum, and SGD+Nesterov momentum. You should see that SGD+momentum achieves a better loss than SGD, and that SGD+Nesterov momentum achieves a slightly better loss (and training accuracy) than SGD+momentum.

```
In [6]:
         num train = 4000
         small data = {
           'X train': data['X train'][:num train],
           'y_train': data['y_train'][:num_train],
           'X val': data['X val'],
           'y val': data['y val'],
         solvers = {}
         for update rule in ['sgd', 'sgd momentum', 'sgd nesterov momentum']:
           print('Optimizing with {}'.format(update rule))
           model = FullyConnectedNet([100, 100, 100, 100], weight scale=5e-2)
           solver = Solver(model, small data,
                           num epochs=5, batch size=100,
                           update rule=update rule,
                           optim config={
                             'learning rate': 1e-2,
                           verbose=False)
           solvers[update rule] = solver
           solver.train()
           print
         plt.subplot(3, 1, 1)
         plt.title('Training loss')

## **RMSProp**

Now we go to techniques that adapt the gradient. Implement <code>rmsprop</code> in <code>nndl/optim.py</code> . Test your implementation by running the cell below.

```
In [7]:
    from nndl.optim import rmsprop

N, D = 4, 5
w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
a = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)

config = {'learning_rate': 1e-2, 'a': a}
next_w, _ = rmsprop(w, dw, config=config)

expected_next_w = np.asarray([
        [-0.39223849, -0.34037513, -0.28849239, -0.23659121, -0.18467247],
        [-0.132737, -0.08078555, -0.02881884, 0.02316247, 0.07515774],
```

next\_w error: 9.502645229894295e-08
cache error: 2.6477955807156126e-09

### Adaptive moments

Now, implement adam in nndl/optim.py . Test your implementation by running the cell below.

```
In [8]:
        # Test Adam implementation; you should see errors around 1e-7 or less
        from nndl.optim import adam
        N, D = 4, 5
        w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
        dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
        v = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)
        a = np.linspace(0.7, 0.5, num=N*D).reshape(N, D)
        config = {'learning rate': 1e-2, 'v': v, 'a': a, 't': 5}
        next w, = adam(w, dw, config=config)
        expected next w = np.asarray([
          [-0.40094747, -0.34836187, -0.29577703, -0.24319299, -0.19060977],

### **Easier optimization**

In the following cell, we'll train a 4 layer neural network having 500 units in each hidden layer with the different optimizers, and find that it is far easier to get up to 50+% performance on CIFAR-10. After we implement batchnorm and dropout, we'll ask you to get 55+% on CIFAR-10.

```
In [10]:
          optimizer = 'adam'
          best_model = None
          layer dims = [500, 500, 500]
          weight scale = 0.01
          learning rate = 1e-3
          lr_{decay} = 0.9
          model = FullyConnectedNet(layer dims, weight scale=weight scale,
                                     use batchnorm=True)
          solver = Solver(model, data,
                           num_epochs=10, batch_size=100,
                           update_rule=optimizer,
                           optim config={
                             'learning rate': learning rate,
                           },
                           lr_decay=lr_decay,
                           verbose=True, print every=50)
          solver.train()
